Where "p" is the density of water, "g" is the acceleration due to gravity, "h" is the height drop, and "η" is the efficiency of the turbines/pumps. Calculating the volume of water required for pumped storage involves considering factors such as the height difference between the reservoirs, the efficiency of the pump and turbine, and the desired energy output.

Fossil fuels are widely used around the world, resulting in adverse effects on global temperatures. Hence, there is a growing movement worldwide towards the introduction and use of green energy, i.e., energy produced without emitting pollutants. Korea has a high dependence on fossil fuels and is thus investigating various energy production and storage ...

Section 2 delivers insights into the mechanism of TES and classifications based on temperature, period and

Aerogels are synthesized porous substances formed by substituting the liquid portion of a gel with a gaseous element while retaining its construction [1]. Certain silica-based aerogels (as shown in Fig. 1 [2]) are practically transparent and weigh less than four times as much as dry air [3]. Aerogels are fascinating due to their unique characteristics, which include ...
