Each of these pressures provides information about the hydraulic system. If the accumulator is fully charged (is holding the maximum amount of hydraulic fluid), the maximum system pressure reading is p_2 . If this reading is too high or too low, the controlling relief valve or pressure compensator may need to be adjusted.

A hydraulic accumulator is a pressure storage reservoir in which an incompressible hydraulic fluid is held under pressure that is applied by an external source of mechanical energy. The external source can be an engine, a spring, a raised weight, or a compressed gas. With a rise in pressure within the hydraulic system, the hydro-pneumatic accumulator collects the pressure fluid and the gas is compressed. If system pressure falls, the compressed gas expands again and forces the stored fluid into the hydraulic circuit. The hydropneumatic accumulator guarantees a fast reaction in case of pressure drop ...

The hydraulic system is pressurized. As system pressure exceeds gas precharge hydraulic pressure fluid flows into the accumulator. Stage D System pressure peaks. The accumulator is filled with fluid to its design capacity. Any further increase in hydraulic pressure is prevented by a relief valve in the hydraulic system. Stage E System pressure ...

If the hydraulic pressure in the system drops, the bladder expands, forcing hydraulic flow from the accumulator back into the system. Accumulator which stores a fluid under pressure and is therefore able to release hydraulic energy. Pressurisation is mainly based on gas pressure (air, nitrogen, "hydropneumatic accumulator") and, more rarely, springs or weights (spring accumulator, weighted accumulator). The latter is the only accumulator which keeps the pressure constant during withdrawal of the volume.

When a downstream action such as actuator movement creates system demand, hydraulic system pressure falls and the accumulator releases the stored, pressurized fluid to the circuit. When movement stops, the charging cycle begins again. Three common types are bladder, piston and diaphragm hydraulic accumulators.
