Can a multi-chamber cylinder replace a traditional hydraulic system?

Multi-chamber cylinders, combined with sensors and an advanced electronic control system, enable much of a machine's hydraulic system to be discarded or downsized, the companies claim. For example, the main control valve - the "heart" of a traditional hydraulic system - can be eliminated, along with excessive pump capacity, piping and hoses.

A piston accumulator is much like a hydraulic cylinder without a rod. Similar to other accumulators, a typical piston accumulator consists of a fluid section and gas section, with the movable piston separating the two. Less common are piston accumulators that replace high-pressure gas with a spring or heavy weight to apply force to the piston.
