How does a flywheel energy storage system work?

The flywheel goes through three stages during an operational cycle, like all types of energy storage systems: The flywheel speeds up: this is the charging process. Charging is interrupted once the flywheel reaches the maximum allowed operating speed. The flywheel energy storage system is now at capacity.

What happens when a flywheel is charged?

Charging is interrupted once the flywheel reaches the maximum allowed operating speed. The flywheel energy storage system is now at capacity. Connecting the rotating element to any type of shaft, it's possible to draw rotational energy from the flywheel: we are discharging the flywheel.

Are flywheel energy storage systems a good investment?

Flywheel Energy Storage systems are impressive in almost all metrics. They can be deployed anywhere, are extremely efficient and responsive and, best of all, have a very low carbon footprint, particularly considering that any units constructed may last indefinitely.

How many kWh can a flywheel charge?

Typical capacities range from 3 kWh to 133 kWh. Rapid charging of a system occurs in less than 15 minutes.

The high specific energies often cited with flywheels can be a little misleading as commercial systems built have much lower specific energy, for example 11 Wh/kg, or 40 kJ/kg.
