What is a 20 megawatt flywheel energy storage system?

The 20-megawatt system marks a milestone in flywheel energy storage technology, as similar systems have only been applied in testing and small-scale applications. The system utilizes 200 carbon fiber flywheels levitated in a vacuum chamber. The flywheels absorb grid energy and can steadily discharge 1-megawatt of electricity for 15 minutes.

How do flywheels store energy?

Flywheels are an ingenious way to store energy. Essentially, a giant rotor is levitated and spun in a chamber by way of magnets. Since there is very little friction, the flywheel spins continually with very little added energy input needed. Energy can then be drawn from the system on command by tapping into the spinning rotor as a generator.
