Fuel cells are electrical generation devices, which mainly use the chemical energy of hydrogen or another fuel to unleash a fuel's latent chemical energy and convert to produce electricity [47,48].Fuel cells work like batteries. They, however, do not run down or need recharging, also produce electricity and heat as long as fuel is supplied [47].A fuel cell is composed of an ...

Fuel cells do not need to be periodically recharged like batteries, but instead continue to produce electricity as long as a fuel source is provided. A fuel cell is composed of an anode, cathode, and an electrolyte membrane. A typical fuel cell works by passing hydrogen through the anode of a fuel cell and oxygen through the cathode.
