This has made energy storage technology a focal point in current power grid development. In the quest for solutions, the existing literature has mostly adopted mathematical modeling, but some issues remain. When conducting smart grid energy storage planning, the following directions are worth considering in subsequent research:

The modern energy economy has undergone rapid growth change, focusing majorly on the renewable generation technologies due to dwindling fossil fuel resources, and their depletion projections [Figure 1]. Figure 1 shows an estimate increase of 32% growth worldwide by 2040 [2, 3], North America and Europe has the highest share whereas Asia, Africa and Latin ...

The energy storage network will be made of standing alone storage, storage devices implemented at both the generation and user sites, EVs and mobile storage (dispatchable) devices (Fig. 3 a). EVs can be a critical energy storage source. On one hand, all EVs need to be charged, which could potentially cause instability of the energy network.

The Office of Electricity's (OE) Energy Storage Division's research and leadership drive DOE's efforts to rapidly deploy technologies commercially and expedite grid-scale energy storage in meeting future grid demands.
