

### Why is energy storage important?

Energy storage can provide a variety of services and its economic rationale is highly application-dependent 8. Numerous studies optimize the size and operation of energy storage within a specific power system to achieve the best economic or environmental outcome.

### What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

### Can energy storage be economically viable?

We also consider the impact of a CO 2 tax of up to \$200 per ton. Our analysis of the cost reductions that are necessary to make energy storage economically viable expands upon the work of Braff et al. 20, who examine the combined use of energy storage with wind and solar generation assuming small marginal penetrations of these technologies.

### Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.

Can energy storage technologies help a cost-effective electricity system decarbonization?

Other work has indicated that energy storage technologies with longer storage durations, lower energy storage capacity costs and the ability to decouple power and energy capacity scaling could enable cost-effective electricity system decarbonization with all energy supplied by VRE 8,9,10.

#### Why is energy storage more cost-effective?

Moreover, increasing the renewable penetration CO 2 tax makes energy storage more cost-effective. This is because higher renewable penetrations increase the opportunities to use stored renewable energy to displace costly generation from non-renewable resources.
