What is gravitational potential energy?

Gravitational potential energy is the work required to move an object in the opposite direction of Earth's gravity, expressed by the equation where E_p is gravitational potential energy, m is the mass of the object, g is the acceleration due to gravity (9.8 m/s^2 on earth), and h is the height of the object.

How do gravity batteries store gravitational potential energy?

Gravity batteries store gravitational potential energy by lifting a mass to a certain height using a pump, crane, or motor. After the mass is lifted, it now stores a certain gravitational potential energy based on the mass of the object and how high it was lifted. The stored gravitational potential energy is then transferred into electricity.
