As the bus decelerates, the CVT transfers energy from the vehicle wheels to the flywheel, spinning it up to speeds of around 60,000rpm. As the vehicle pulls away from rest, the CVT returns energy from the flywheel to the wheels, reducing the engine power requirement and hence lowering fuel consumption.

Flywheel is a rotating mechanical device used to store kinetic energy. It usually has a significant rotating inertia, and thus resists a sudden change in the rotational speed (Bitterly 1998; Bolund et al. 2007). With the increasing problem in environment and energy, flywheel energy storage, as a special type of mechanical energy storage technology, has extensive ...
