

How do thermochemical heat storage systems work?

Thermochemical heat storage systems, on the other hand, are based on chemical reactions. Reduce peak demand and level demand by storing energy when there is less demand and releasing when there is high demand. Reduce CO₂ emissions and costs by making sure energy is used when it is cheaper and there is more renewable energy in the mix.

Sensible heat storage systems, considered the simplest TES system [], store energy by varying the temperature of the storage materials [], which can be liquid or solid materials and which does not change its phase during the process [8, 9] the case of heat storage in a solid material, a flow of gas or liquid is passed through the voids of the solid ...

Energy cannot be created or destroyed, it can only be moved or change form. The only way to cool an object down is to remove the heat (energy) from it. This requires the ability to move the heat to a different location or object or change the state of the original object (solid to liquid or liquid to gas) in a way that requires energy to do so.
