A Phase Change Material (PCM) is a type of latent heat storage material that absorbs or releases heat by undergoing an isothermic or quasi-isothermic phase transformation from liquid to vapor, from solid to liquid, or vice versa. ... the second considers transport on a highway where the speed limit is 90 km h<sup>-1</sup> ...

Heat Highway is investigating interregional heat transfer networks (HTN), which combines four areas: industrial waste heat and other sustainable sources, district heating networks, industrial process heat sinks and storage. These HTNs connect consumption centers and industrial sites, by travelling through areas with other heat sources and sinks.

High-temperature aquifer thermal energy storage (HT-ATES) systems can help in balancing energy demand and supply for better use of infrastructures and resources. The aim of these systems is to store high amounts of heat to be reused later. HT-ATES requires addressing problems such as variations of the properties of the aquifer, thermal losses and the ...

Then, the fern-fractal finned LHS unit's heat storage performance is far enhanced because of its superior spatial layout, which establishes a "thermal highway network" (i.e., fast heat flow path) but also improves the convective heat transfer between fins and PCM. In addition, the temperature difference of PCM in the conventional LHS device ...
