Global renewable capacity could rise as much in 2022-2027 as it did in the previous 20 years, according to the International Energy Agency. This makes energy storage increasingly important, as renewable energy cannot provide steady and interrupted flows of electricity - the sun does not always shine, and the wind does not always blow.

Solar batteries work best at moderate temperatures between 20 and 25 degrees Celsius. At these temperatures, solar batteries can maintain their maximum efficiency and store energy effectively. However, when temperatures rise above or fall below this range, the efficiency and performance of the battery can be negatively impacted.
