Drinking too much water is rarely a problem for healthy, well-nourished adults. Athletes occasionally may drink too much water in an attempt to prevent dehydration during long or intense exercise. When you drink too much water, your kidneys can't get rid of the excess water. The sodium content of your blood becomes diluted.

1. Decide How Much Water You Need to Store. FEMA recommends stockpiling at least 14 gallons of water per person, giving you 1 gallon daily for two weeks. However, because most people use more than a gallon per day and water outages can last a long time, it is better to aim for a minimum of 60-120 gallons per person.

However, because water outages can last for much longer than this, everyone should aim to have at least a 30-day supply of water ... tables, and all the information required to stockpile and store emergency water safely. It couldn't be easier. There's no confusion or headaches. Just clarity and peace of mind. NOW 50% OFF! Learn More. Leave ...

Both groups were also told to aim for 10,000 steps a day, and those who drank the glasses of water better adhered to this. Davy guesses this is because mild dehydration of around 1-2% is quite ...
