

Can hydraulic accumulators be repaired?

Yes, hydraulic accumulators can be repaired by our specialist manufacturing and repair teams. They not only need repairs and maintenance, but also periodic recertification, which includes a volumetric expansion test to check the elasticity of the material.

What is a hydraulic accumulator?

Hydraulic Accumulators store energy in the form of pressurized fluid, often used to improve hydraulic system efficiency. Here at Rotec Hydraulics Ltd, we specify, sell and recertify accumulators. We are proud to be the only Parker Hannifin Authorised Recertification Centre in the South West of the UK.

Can apex hydraulics repair a hydraulic accumulator?

Apex Hydraulics can repair hydraulic accumulators from all leading manufacturers. Our specialist manufacturing and repair teams have the knowledge and expertise to repair even obsolete hydraulic accumulators, ensuring your machinery can be up and running again in record time.

Do hydraulic accumulators need to be recertified?

According to the European Pressure Equipment Directive (PED), hydraulic accumulators must be repaired, tested, and recertified by a competent person. Apex Hydraulics, with our ISO 9001:2015 certification, can provide you with unbeatable technical expertise in this area.

Can hydraulic accumulators be recycled?

Hydraulic accumulators can be recycled, but they must be expertly depressurised beforehand. Due to this requirement, many scrap metal yards are unable to accept them. Apex Hydraulics offers a sustainable accumulator recycling service for any obsolete accumulators.

What causes accumulators to fail?

Operational issues that these accumulators can develop include: One common cause of bladder/diaphragm accumulator failure is overpressurisation inside the hydraulic system, frequently due to sudden pressure spikes. Also, fluid contamination can inflict serious harm to a bladder or a diaphragm membrane as well.

Description. Positive displacement hydraulic accumulators serve as self-contained sources of hydraulic pressure. Our gas-charged piston-based accumulators allow hydraulic systems to quickly respond to changes in pressure demand and can also smooth out pulsation from pumps and other cycling devices up and downstream.

The volume of gas in a hydraulic accumulator is precharged to around 80/90% of the minimum system working pressure. Once the system is in operation, the hydraulic pump is responsible for increasing system pressure which forces fluid into the accumulator.

Accumulators are devices, which simply store energy in the form of fluid under pressure. This energy is in the form of potential energy of an incompressible fluid, held under pressure by an external source against some dynamic force.
