

Does immersion thermal management improve the performance of lithium-ion battery modules? Immersed thermal management shows distinct advantageswhile cooling the lithium-ion battery modules. This work conducts numerical-experimental studies to analyze the significance of optimizing system configurations and operational modes by using immersion thermal management.

#### Is immersion cooling an effective method for thermal management of LIBS?

In summary, immersion cooling is an effective method for the thermal management of LIBs because it has strong heat dissipation capabilities and can reduce temperature increases under a high C-rate discharge. However, research on immersion cooling is still in its early stages and has not been widely conducted.

#### What is a liquid-immersed battery thermal management system?

A novel liquid-immersed battery thermal management system was designed. The No. 10 transformer oil with insulation and cooling properties is a suitable choice for the immersion cooling liquid. The liquid-immersed battery thermal management system can significantly decrease the maximum temperature and temperature difference of the battery module.

### What is the optimal thermal management performance for liquid-immersed cooling?

The results demonstrated that the liquid-immersed cooling scheme with the immersion depth of 13.2 cm (the full immersion height) and the flow rate of 0.8 L/min exhibited the optimal thermal management performance under the discharge rate of 2C (100A) and the ambient temperature of 25 °C.

### Does immersion improve battery cooling performance?

Limitedly increasing the batteries' staggered distance boosts cooling performance. Complete immersion reveals the optimal cooling effectcompared to other depths. A "marginal effect" is observed in improving cooling effect with flow rate boosted. Immersed thermal management shows distinct advantages while cooling the lithium-ion battery modules.

Does immersion liquid affect battery thermal performance?

Numerically and experimentally, the effects of batteries' staggered distance, reciprocating flow period of immersion liquid, immersion ratio, as well as the volume flow rate of immersion liquid on battery thermal performances are investigated.

Recently, the energy crisis and environmental pollution have emerged as significant concerns. Electric vehicles (EVs) have garnered significant attention as an alternative to traditional automobiles to alleviate these issues [1, 2].Lithium-ion (Li-ion) batteries are considered the best candidate for EVs due to their high energy density, power density, long ...

Overheating of Li-ion cells and battery packs is an ongoing technological challenge for electrochemical energy conversion and storage, including in electric vehicles. ...
