How is energy stored in an inductor?

Energy in the inductor is stored in the form of a magnetic field. When current is applied, the energy of the magnetic field expands and increases the energy stored in the inductor. The energy remains constant as long as the current is maintained. If the current is removed, the energy is discharged as the magnetic field contracts.

How does a pure inductor work?

This energy is actually stored in the magnetic field generated by the current flowing through the inductor. In a pure inductor, the energy is stored without loss, and is returned to the rest of the circuit when the current through the inductor is ramped down, and its associated magnetic field collapses. Consider a simple solenoid.

What is the rate of energy storage in a Magnetic Inductor?

Thus, the power delivered to the inductor  $p = v \cdot i$  is also zero, which means that the rate of energy storage is zero as well. Therefore, the energy is only stored inside the inductor before its current reaches its maximum steady-state value,  $I_m$ . After the current becomes constant, the energy within the magnetic becomes constant as well.

How does inductance affect energy stored in an inductor?

Inductance of the coil: The amount of energy stored in an inductor is directly proportional to its inductance. Higher the inductance, higher will be the energy stored. Current flowing through the coil: The energy stored is directly proportional to the square of the current flowing through the inductor.

What are the characteristics of an inductor?

Current: Another vital factor is the amount of current flowing through the inductor - the energy stored is directly proportional to the square of this current. Rate of Change of Current: The rate at which current increases or decreases is another crucial characteristic, as it influences how quickly energy is stored or released by the inductor.

What is the formula of energy stored in inductor?

In Physics, especially in the study of electromagnetism, it's of utmost importance to comprehend the fundamental formula of energy stored in inductor. This formula is represented as:  $W = \frac{1}{2} L I^2$ . In this equation,  $W$  represents the energy stored in the inductor,  $L$  is the inductance, and  $I$  is the current.
