Thanks to the unique advantages such as long life cycles, high power density and quality, and minimal environmental impact, the flywheel/kinetic energy storage system (FESS) is gaining steam recently.

The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1) $E = \frac{1}{2} I \omega^2$ [J], where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm²], and ω is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...

On 14 April the world's largest flywheel left the Siemens Energy factory in Muelheim, Germany, and is now on its way to the Moneypoint power station located in Southwest Ireland. The 177 tonne flywheel will complete the synchronous condenser based grid stabilisation plant that Siemens Energy is currently developing at ESB's Moneypoint site.

The anatomy of a flywheel energy storage device. Image used courtesy of Sino Voltaics . A major benefit of a flywheel as opposed to a conventional battery is that their expected service life is not dependent on the number of charging cycles or age. The more one charges and discharges the device in a standard battery, the more it degrades.
