"This is when long - term energy storage becomes crucial." Long duration energy storage (LDES) generally refers to any form of technology that can store energy for multiple hours, days, even weeks or months, and then provide that energy when and if needed.

Should energy storage be co-optimized?

Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible. Goals that aim for zero emissions are more complex and expensive than net-zero goals that use negative emissions technologies to achieve a reduction of 100%.

Energy storage as a utility transmission and distribution (T& D) asset in New York (also known as a non-wires alternative to building expensive T& D infrastructure), DC-coupled solar-plus-storage in Massachusetts and the deployment of mobile battery energy storage to provide locational flexibility were the three case studies featured.

For energy storage, the capital cost should also include battery management systems, inverters and installation. The net capital cost of Li-ion batteries is still higher than \$400 kWh⁻¹ storage.
