What is energy storage & how does it work?

As installations of wind turbines and solar panels increase -- especially in China -- energy storage is certain to grow rapidly. They are part of the arsenal of clean energy technologies that will enable a net zero emissions future. Without them, the world will never be able to move away from fossil fuels entirely. How does it work?

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Are batteries the future of energy storage?

Batteries offer one solution because they can quickly store and dispatch energy. As installations of wind turbines and solar panels increase -- especially in China -- energy storage is certain to grow rapidly. They are part of the arsenal of clean energy technologies that will enable a net zero emissions future.

How will energy storage systems impact the developing world?

Mainstreaming energy storage systems in the developing world will be a game changer. They will accelerate much wider access to electricity, while also enabling much greater use of renewable energy, so helping the world to meet its net zero, decarbonization targets.

What would happen if there were no energy storage?

Without energy storage, the costs of the energy transition would be higher. Countries would need to "overbuild" wind and solar plants or look at other ways of integrating renewable energy, such as by managing demand -- asking consumers to use less electricity because the wind is not blowing, for example -- or importing electricity from abroad.
