Against the backdrop of swift and significant cost reductions,the use of battery energy storage in power systems is increasing. Not that energy storage is a new phenomenon: pumped hydro-storage has seen widespread deployment for decades. There is,however,no doubt we are entering a new phase full of potential and opportunities.

Could a new energy source make batteries more powerful?

Columbia Engineers have developed a new,more powerful "fuel" for batteries--an electrolyte that is not only longer-lasting but also cheaper to produce. Renewable energy sources like wind and solar are essential for the future of our planet,but they face a major hurdle: they don't consistently generate power when demand is high.

Why is battery storage important?

Battery storage can help with frequency stability and control for short-term needs, and they can help with energy management or reserves for long-term needs. Storage can be employed in addition to primary generation since it allows for the production of energy during off-peak hours, which can then be stored as reserve power.
