

Mechanical chronograph movement &#183; Hand-wound &#183; IWC-manufactured 59360 calibre (59000-calibre family) &#183; 8-day power reserve when fully wound &#183; Power reserve display &#183; Date display &#183; Stopwatch function with minutes and seconds &#183; Small hacking seconds &#183; Indexless balance with four golden weight screws on the balance

The ETA Valjoux 7750 chronograph movement is well-known in the world of watchmaking for being tough, reliable, and versatile. Since it was first introduced in the early 1970s, it has gained a strong reputation for being accurate and long-lasting, which has made it a favourite chronograph calibre among both watchmakers and enthusiasts. In addition, the 7750 ...

Powering this exceptional timepiece is the reliable and accurate IWC Caliber 79320 automatic movement. With a power reserve of approximately 44 hours, the watch ensures precise timekeeping and convenience for the wearer. The movement can be admired through the transparent case back, revealing the meticulous craftsmanship and attention to detail.

Before a mechanical watch can start moving, it needs an energy source to drive it: the mainspring. It stores the energy that is needed to move the hands and wheel train. In all hand-wound watches the mainspring is manually wound by turning the crown, while in an automatic watch, it is recharged simply by the movement of the wearer's arm.

The IWC-typical Double Moon™ display shows the moon as it can be seen from the Northern and Southern hemispheres. Thanks to a special reduction gear, the indication will only deviate from the moon's actual orbit by one day after 577.7 years. ... The Portugieser Perpetual Calendar is powered by the IWC-manufactured 52616 caliber movement ...

It is a very smooth movement to operate with a satisfying and noticeable date change from the date aperture at 6 O'clock and smooth flow of the hands when changing the ...

The IWC caliber 69380 is an automatic column-wheel chronograph movement. The 69380 is part of the 69000 family and is found 3879 and 3891 series watches. This is an in-house "IWC manufactured" caliber, introduced in an effort to move previous chronograph models away from the (now unavailable to non-Swatch Group brands) ETA/Valjoux caliber 7750 IWC's own ...

Ticking away inside the case is the newly developed IWC-manufactured movement from the 50000-calibre family, measuring a hefty 37.8 millimetres in diameter. ... hand-wound Portofino will keep running for an unusually long time. It is capable of storing enough energy for a full nine days. Instead of making use of all this potential, however, IWC ...

Here, 20 watchmakers focus on further increasing the accuracy of the mechanism until they meeting the strict tolerances required. "Over a period of 24 hours, an in-house movement that leaves our workshops may gain up to six seconds but must never lose time," says Kai Stiewe, Head of Precision Adjustment at IWC.

Experience precision and sophistication with the IWC Caliber 79420 - a mechanical movement designed for chronograph watches with a flyback function and soft iron inner case. A favorite among luxury watch collectors. Learn more on watchwired .

As the movement is hand-wound and has no oscillating mass, the small globe is visible from the front and back. The idea for this unique concept came from an IWC apprentice watchmaker. The Portugieser Hand-Wound Tourbillon Day & Night is powered by the IWC-manufactured 81925 caliber, which is elaborately finished with circular Geneva stripes.

Full details and images of the IWC caliber 82200, including a list of all watches using this movement. ... All watches using the IWC 82200 movement: IW3581-02 IWC Da Vinci ...

1. IWC watches utilize a sophisticated mechanism called a "movement" to store energy effectively. This movement incorporates components such as the mainspring and gear train, ensuring efficient energy transfer.
2. The design includes a rotor that harnesses kinetic energy from the wrist's motion, enabling self-winding capabilities.
- 3.

However, the quick-action switch siphons off a little energy every night when the date display moves forward. It stores this energy and then discharges it precisely at the end of the month or year when, in addition to the date and month disc, the leap year disc also needs to be advanced. The digital display dates back to the IWC Pallweber ...
