Energy storage is the capture of energy produced at one time for use at a later time [1] to reduce imbalances between energy demand and energy production. A device that stores energy is generally called an accumulator or battery. Energy comes in multiple forms including radiation, ...

The International Renewable Energy Agency predicts that with current national policies, targets and energy plans, global renewable energy shares are expected to reach 36% and 3400 GWh of stationary energy storage by 2050. However, IRENA Energy Transformation Scenario forecasts that these targets should be at 61% and 9000 GWh to achieve net zero ...

As America moves closer to a clean energy future, energy from intermittent sources like wind and solar must be stored for use when the wind isn't blowing and the sun isn't shining. The Energy Department is working to

develop new storage technologies to tackle this challenge -- from supporting research on battery storage at the National Labs, to making investments that take ...

In electrical energy storage science, "nano" is big and getting bigger. One indicator of this increasing importance is the rapidly growing number of manuscripts received and papers published by ACS Nano in the general area of energy, a category dominated by electrical energy storage. In 2007, ACS Nano's first year, articles involving energy and fuels accounted ...
