

Can liquid cooling reduce energy consumption in data centers?

Liquid cooling is highly valuable in reducing energy consumption of cooling systems in data centers. We survey the landscape on different deployments of liquid cooling and are helping develop a standard specification for liquid-cooled racks. Liquid cooling in data centers can be implemented with a broad range of technologies.

What is a liquid cooled system?

Most liquid-cooled solutions are hybrid technologies where only a part of the heat load is removed by the liquid. The remaining load is removed by traditional air cooling. Thus, liquid cooling solutions that transfer heat near the source generally incur additional cost compared to air-cooled IT equipment in a standard rack.

What is liquid cooling in data centers?

Liquid cooling in data centers can be implemented with a broad range of technologies. These technologies range from transferring heat to a liquid far from the source (e.g. computer room air handlers (CRAHs)) to immersion cooling where the heat transfer takes place on the surface of the hot electronic components.

Should data centres use liquid cooling?

Consumption of IT equipment in data centres calls for energy-efficient cooling solutions. Liquid cooling, with its efficient heat dissipation and high energy-saving characteristics, is becoming greatly preferred in China and is snow-balling with successful business cases already.

What is the difference between air cooled and liquid cooled energy storage?

The implications of technology choice are particularly stark when comparing traditional air-cooled energy storage systems and liquid-cooled alternatives, such as the PowerTitan series of products made by Sungrow Power Supply Company. Among the most immediately obvious differences between the two storage technologies is container size.

Can a liquid-cooled rack heat exchanger be used in a data center?

A one-rack system can use internal to the rack liquid-to-air heat exchangers if facility cooling water is not available. Even at a small scale, a fully populated liquid-cooled rack could generate significant heat into the data center. Best practice air management must still be used to prevent hot spots.
