4. Pumped-Hydro Energy Storage o Typically, pumping would take place by buying electricity during times when prices are low, which is when demand is low or the availability of electricity from other sources is high (e.g. a windy and sunny day). o Generation would take place during times of high demand (such as during evenings) when prices are high.

8. ELECTROCHEMICAL ENERGY Fuel cells : In contrast to the cells so far considered, fuel cells operate in a continuous process. The reactants - often hydrogen and oxygen - are fed continuously to the cell from outside. Fuel cells are not reversible systems. Typical fields of application for electrochemical energy storage systems are in portable ...

16. Common Challenges o Main drawback of the SMES technology is the need of large amount power to keep the coil at low temperature, combined with the high overall cost for the employment of such unit. o To achieve commercially useful levels of storage, around 1 GW.h (3.6 TJ) a SMES installation would need a loop of around 100 miles (160 km).
