

Due to their high theoretical energy density ( $2600 \text{ Wh kg}^{-1}$ ) and affluent reserve & environmental friendliness of sulfur, lithium-sulfur (Li-S) batteries are considered as the next generation of energy storage excellence [1]. Many researchers have done extensive work over the last few decades to boost the development of Li-S batteries [2, 3].

The safety concern is the main obstacle that hinders the large-scale applications of lithium ion batteries in

electric vehicles. With continuous improvement of lithium ion batteries in energy density, enhancing their safety is becoming increasingly urgent for the electric vehicle development. Thermal runaway is the key scientific problem in battery safety research.

High-capacity or high-voltage cathode materials are the first consideration to realize the goal. Among various cathode materials, layered oxides represented by  $\text{LiMO}_2$  can produce a large theoretical capacity of more than 270 mAh/g and a comparatively high working voltage above 3.6 V, which is beneficial to the design of high energy density LIBs [3].

Considering the similar physical and chemical properties with Li, along with the huge abundance and low cost of Na, sodium-ion batteries (SIBs) have recently been considered as an ideal energy storage technology (Fig. 2). Actually, SIBs started to be investigated in the early 1980s [13], but the research related to SIBs decreased significantly after the successful ...

Energy storage plays an important role in the development of portable electronic devices, electric vehicles and large-scale electrical energy storage applications for renewable energy, such as solar and wind power.

Lithium-ion batteries (LIBs) have dominated most of the first two applications due to the highest energy density and long cycle life. Room-temperature ...

From the perspective of energy storage/conversion mechanism, lithium (Li) metal stored by conversion chemistry has the lowest electrochemical potential (-3.04V vs SHE) and the highest theoretical capacity (3860 mAh g<sup>-1</sup>, or 2061 mAh cm<sup>-3</sup>) is known as the "holy grail" anode that far surpasses the graphite anode relying on intercalation chemistry, and has ...

Abstract: Voltage fade is a major problem in battery applications for high-energy lithium- and manganese-rich (LMR) layered materials. As a result of the complexity of the LMR structure, the voltage fade mechanism is not well understood. Here we conduct both in situ and ex situ studies on a typical LMR material (Li<sub>1.2</sub>Ni<sub>0.15</sub>Co<sub>0.1</sub>Mn<sub>0.55</sub>O<sub>2</sub>) during charge-discharge ...

Aqueous zinc metal batteries (ZMBs) are considered promising candidates for large-scale energy storage. However, there are still some drawbacks associated with the cathode, zinc anode, and electrolyte that limit their practical application. In this Focus Review, we focus on unveiling the chemical nature of aqueous ZMBs. First, cathode materials and electrochemical ...
