The combined-heat-and-power (CHP) plants play a central role in many heat-intensive energy systems, contributing for example about 10% electricity and 70% district heat in Sweden. This paper considers a proposed system integrating a high-temperature thermal storage into a biomass-fueled CHP plant.

This process moves the thermocline downward and adds thermal energy to the system for storage. Reversing the flow moves the thermocline upward and removes thermal energy from the system to generate steam and electricity. Buoyancy effects create thermal stratification of the fluid within the tank, which helps to stabilize and maintain the ...

Particle thermal energy storage is a less energy dense form of storage, but is very inexpensive (\$2-\$4 per kWh of thermal energy at a 900°C charge-to-discharge temperature difference). The energy storage system is safe because inert silica sand is used as storage media, making it an ideal candidate for massive, long-duration energy storage.

A CSP system usually consists of a concentrated solar field, thermal storage system (TES), and power cycle, which has a schedulable power-generation ability [9], [10] because of the large quantities of energy stored in

the TES, and it can be coupled with a PV plant to compensate for the disadvantages of the intermittences of the PV power output.

Thermal energy storage (TES) systems can store heat or cold to be used later, at different temperature, place, or power. The main use of TES is to overcome the mismatch between energy generation and energy use (Mehling and Cabeza, 2008, Dincer and Rosen, 2002, Cabeza, 2012, Alva et al., 2018). The mismatch can be in time, temperature, power, or ...
