Off-grid microgrids. Off-grid microgrids are constructed where there is a significant need for electricity but no access to a wide-area electrical grid. Islands that are too far from the mainland are typically served by their own microgrid. In the past, island microgrids were usually built around diesel or heavy fuel oil generators.

The off-grid wind-solar-diesel microgrid should make full use of renewable energy to compensate the load

demand. BESS and DGs are employed to cover the balanced load. The equations are as follows:
