

How is Molybdenum carbide synthesized?

Synthesis of the hierarchically porous molybdenum carbide The 1 mL gelatin-mediated Mo-ion matrix hydrogel was sprayed on PI (plastic, from hongxingwang plastic material Co., Ltd.) which stick on Polyethylene glycol terephthalate (PET, plastic, form Jubang Plastic Material Co., Ltd.) substrates.

How does a hydrogel convert into a Molybdenum carbide?

When ablated by the CO₂ laser, the hydrogel absorb IR energy, converting it to heat and generating high local temperature instantly. Subsequent vaporizing and reaction of the hydrogel/PI complex facilitate the conversion into molybdenum carbides/LIG with a hierarchical porous structure.

What is a porous Molybdenum carbide?

Porous molybdenum carbides are synthesized from gelatin-mediated hydrogel containing molybdenum ions, facilitated by the self-assembly of gelatin during the carbonization. This self-assembly enables the macroscopic arrangement of the lamellar hydrogel/metal-ion matrix into hierarchically layered porous structures.

Can Molybdenum carbide-based composites be used as capacitive electrodes?

This work presents a promising approach for synthesizing advanced molybdenum carbide-based composites and proposes an alternative strategy for leveraging these composites as capacitive electrodes to enhance electrochemical performance. Changlin Yang: Writing - original draft, Formal analysis, Data curation.

How much laser power is needed to convert hydrogel to Molybdenum carbide?

With a scan rate of 60 mm s⁻¹, 7 of laser power convert the hydrogel to molybdenum carbide composite as the sample remains the hierarchical porous structure, while higher laser power below 9 results in the molybdenum carbide composite with pulverization.

Are 2D carbides a good electrocatalyst for hydrogen evolution?

Anasori, B. et al. Control of electronic properties of 2D carbides (MXenes) by manipulating their transition metal layers. *Nanoscale Horiz.* 1, 227-234 (2016). Seh, Z. W. et al. Two-dimensional molybdenum carbide (MXene) as an efficient electrocatalyst for hydrogen evolution. *ACS Energy Lett.* 1, 589-594 (2016).

Supercapacitive behavior and energy storage properties of molybdenum carbide ceramics synthesized via ball milling technique, *Ceramics International* (2024), (Dr. Bhargav).

Energy production and energy storage materials are highly in demand due to their versatility, stability, sustainability, and better conductivity. Low-cost and highly efficient electrode materials (cathode/anode) for electrochemical supercapacitors (SCs) have been highly explored in the last two decades. Herein, we have synthesized Mo₂C via a facile, cost ...

Bimetallic carbides with high activity and stability are promising potential materials for energy-storage application. However, the researches about Fe_2MoC as electrode material on supercapacitors are comparatively weak, and the processing methods of Fe_2MoC were also relatively few. Herein, a simple hydrothermal method, combining with carbothermic ...

It is essential to develop highly active and robust electrocatalysts for the hydrogen evolution reaction (HER) to address the issue of sustainable energy with hydrogen as a renewable energy source. Molybdenum carbide (Mo_2C) has been regarded as a promising substitute for noble metal catalysts during the HER process. However, the limited number of ...

Molybdenum carbide MXene (Mo_2CT_x) was synthesized by immersing $\text{Mo}_2\text{Ga}_2\text{C}$ in hydrofluoric acid ...
V. et al. High-rate electrochemical energy storage through Li^+ intercalation ...

The phases of molybdenum carbide are complex due to ... Inset is the ratio of overpotentials at 1st cycle and 1000th cycle for three phases of molybdenum carbide. e Free-energy diagrams for ...

Ultrathin carbon deficient molybdenum carbide $\alpha\text{-MoC}_{1-x}$ enables high-rate mg-ion-based energy storage
J. Phys. Chem. Lett., 12 (2021), pp. 4434 - 4439 Crossref View in Scopus Google Scholar

It is the most promising candidate because of its high energy storage capacity from renewable sources [13,25]. Hydrogen has many potential applications such as powering the non-polluting vehicles, domestic heating and as air craft fuel [26]. ... In Molybdenum carbide three different types of bonding exists; one is the rearrangement of the ...

Dual-electron transfer with Mg^{2+} -ion intercalation outperforms typical alkali metal-ion (Li^+ , Na^+ , K^+) systems with superior charge storage efficiency while the neutral electrolytes can achieve a working voltage beyond the hydrolysis window of 1.23 V. Hence, aqueous Mg-ion electrolytes are promising for electrochemical energy storage devices to boost the energy ...

In addition, many options for energy storage have been made available by the excellent optical, electrical, and magnetic properties of 2D materials [16, 17]. ... Two-dimensional molybdenum carbide (MXene) as an efficient electrocatalyst for ...

3 · Molybdenum carbide and molybdenum sulfide carbide, with electronic structures similar to those of Pt, have been extensively incorporated into N-doped carbon materials from ...

Metal- CO_2 batteries utilize metals with negative electrode potentials, such as lithium, sodium, aluminum, magnesium, etc. as the cathode, CO_2 in the air as the cathode active material, and organic electrolytes as the electrolyte energy storage device [[1], [2], [3]]. Among these metal batteries, the Li-CO_2 battery is regarded as the best candidate with relatively ...

Lim, K. R. G. et al. Rational design of two-dimensional transition metal carbide/nitride (MXene) hybrids and nanocomposites for catalytic energy storage and conversion. ACS Nano 14, 10834-10864 ...

DOI: 10.1016/j.ceramint.2023.12.276 Corpus ID: 266546329; Supercapacitive behavior and energy storage properties of molybdenum carbide ceramics synthesized via ball milling technique

Titanium carbide (Ti_3C_2)-based MXenes are a potential class of materials for energy storage applications. MXenes are transition metal carbides, nitrides, or carbonitrides that are two-dimensional (2D) materials with special characteristics like high surface area, electrical conductivity, and exceptional mechanical flexibility.

The laser-patterned carbide, using MoC_x as an example, performs as an energy storage interdigitated supercapacitor electrode having a wide operational temperature range ($-50\text{ }^\circ\text{C}$ to $300\text{ }^\circ\text{C}$ in ...

Molybdenum-based MXene and other types of single- and double-transition metal carbide MXene phases have been studied for a variety of applications including electrocatalysts for water splitting application, electromagnetic interference (EMI) shielding, and electrochemical energy storage and show relatively stable properties as compared to other ...

Nanostructured transition metal carbides (TMCs) with superior electrochemical properties are promising materials for high-efficiency energy-storage applications. Herein one-dimensional ...

molybdenum titanium carbide ... Electrochemical energy-storage (EES) devices are a major part of energy-storage systems for industrial and domestic applications. Herein, a two-dimensional (2D) transition metal carbide MXene, namely Mo_2TiC_2 , was intercalated with Sn ions to study the structural, morphological, optical, and electrochemical

Keywords: porous carbon, ternary composite, molybdenum oxide, molybdenum carbide, energy storage. 1. Introduction. The high demand for energy in conjunction with the rapid depletion of fossil fuels has made it essential to develop alternative energy sources.

Electrochemical energy-storage (EES) devices are a major part of energy-storage systems for industrial and domestic applications. Herein, a two-dimensional (2D) transition metal carbide MXene, namely Mo_2TiC_2 , was intercalated with Sn ions to study the structural, morphological, optical, and electrochemical energy-storage effects. The Sn^{2+} ...

Hydrogen is an ideal alternative energy for fossil fuels to solve aggravating environmental and energy problems. Electrocatalytic hydrogen evolution reaction (HER) driven by renewable electricity (sunlight, wind, tide, etc.) is considered to be one of the most promising approaches for hydrogen production. However, its large-scale applications are greatly limited ...

As similar with the tungsten carbide and molybdenum carbide, other metal carbides such as titanium carbide and vanadium carbide also possess promising catalytic activity for ORR. Jalan et al. found that at 200 °C in phosphoric acid, Pt/TiC showed six times higher ORR activity than that of conventional Pt/C.

Molybdenum carbide (Mo_xC)-based nanomaterials have shown competitive performances for energy conversion applications based on their unique physicochemical properties. A large surface area and proper surface atomic configuration are essential to explore potentiality of Mo_xC in electrochemical applications. Although considerable efforts are made ...

This work presents a promising approach for synthesizing advanced molybdenum carbide-based composites and proposes an alternative strategy for leveraging these composites as capacitive electrodes to enhance electrochemical performance. ... Laser-sculptured ultrathin transition metal carbide layers for energy storage and energy harvesting ...

The laser-catalytic DRM achieves high yields of H_2 (14300.8 mmol h⁻¹ g⁻¹) and CO (14949.9 mmol h⁻¹ g⁻¹) with satisfactory energy efficiency (0.98 mmol kJ⁻¹), providing a promising ...

Molybdenum Carbide-Based Electrocatalysts for Hydrogen Evolution Reaction. Mao Miao, Mao Miao. Key Laboratory of Material Chemistry for Energy Conversion and Storage (Ministry of Education), Hubei Key Laboratory of Material Chemistry and Service Failure, School of Chemistry and Chemical Engineering, Wuhan National Laboratory for Optoelectronics ...

Single site Co-substituted 2D molybdenum carbide ($\text{Mo}_2\text{CT}_x\text{Co}$) can be obtained from a Co-substituted Mo_2GaC MAX precursor 90. ... Energy Storage Mater. 41, 343-353 (2021).

This article is part of the Research Topic Hierarchical Materials for Advanced Energy Storage View all 11 articles. Hierarchical Porous Molybdenum Carbide Based Nanomaterials for Electrocatalytic Hydrogen Production. Yan Liu 1 Juanjuan Huo 1 Jiaojiao Guo 1 Li Lu 1 Ziyan Shen 1 Weihua Chen 2 Chuntai Liu 2 Hao Liu 1,3 *

Enhanced Electrochemical Performance of MWCNT-Assisted Molybdenum-Titanium Carbide MXene as a Potential Electrode Material for Energy Storage Application ... Supercapacitors have been a vital ...
