

Can electric energy storage be used for drilling based on electric-chemical generators?

The article outlines development of an electric energy storage system for drilling based on electric-chemical generators. Description and generalization are given for the main objectives for this system when used on drilling rigs isolated within a single pad, whether these are fed from diesel gensets, gas piston power plants, or 6-10 kV HV lines.

Can energy storage systems improve energy eficiency of DPS-powered rigs?

Based on average daily power consumption statistics and load diagrams for various rig operating modes at more than fifty pads equipped with DPS, it was proposed to improve the energy efficiency of individual DPS-powered rigs by introducing energy storage systems (Fig. 1).

Can modified drilling rig diesel generator power-plant reduce fuel consumption and emissions?

The analysis has indicated that fuel consumption of thus modified drilling rig diesel generator power-plant can be reduced by about 12% compared to current practice in the field relying on human operator-based decision making, which would also result in proportional reduction of carbon-dioxide emissions.

How can energy storage system reactive power qess be fully-decoupled from PESS bidirectional control? In this way, controlled delivery of energy storage system reactive power QESS to the grid can be fully-decoupled from the active power flow PESS bidirectional control (needed for periodic battery recharging after peak active load-related discharging events).

What are instantaneous grid active and reactive power requirements?

In practical applications, instantaneous grid active and reactive power requirements could be provided within the framework of supervisory grid voltage and frequency droop control (see, e.g.) in combination with instantaneous diesel power-plant output measurement. © 2016 Elsevier Ltd. What is the energy consumption mode of a rig?

As for the rigs, this energy consumption mode is most typical of run-in-hole/put-out-of-hole operations (RIH/POOH).

Based on the number of running generators and instantaneous active and reactive power demand (field data), the rule-based power-plant control strategy distributes the grid load between the active power-plant generators and the energy storage system.
