Thermal energy storage (TES) is crucial in the efficient utilization and stable supply of renewable energy. This study aims to enhance the performance of shell-and-tube latent heat thermal energy storage (LHTES) units, particularly addressing the issue of the significant melting dead zones at the bottom, which are responsible for the long charging time.

The average energy storage rate of the corresponding designs are 158 W, 133 W, 169 W, 197 W and 208 W, in the same order. Design L5 proved to be the optimum design based on both the scales of melting time and energy storage yielding maximum values of time saving and average energy storage rate, respectively. 4.
