Pictured above, it has a total installed capacity of 30MW with 120 high-speed magnetic levitation flywheel units. Every 12 units create an energy storage and frequency regulation unit, the firm said, with the 12 combining to form an array connected to the grid at a 110 kV voltage level.

Equation (6) shows that the total energy of the system significantly increases in the fixed initial frequency. It means that with the same frequency fed to a normal FESS and a CFESS with the same flywheel, the CFESS will store much more energy because of its higher flywheel speed and also energy stored in other rotating parts.
