Do flammable chemicals cause storage tank failures?

All past accident analysis (PAA) reports bear this out (Lees, 2005). Due to the large-scale processing of crude oil, gasoline, other liquid fuels, and pressure-liquefied hydrocarbons across the world, 97% of all storage tank failures involve flammable chemicals.

Are storage tank accidents related to hazardous chemical substance (HCS)?

As a commonly used container in the industrial process, storage tank accidents involving hazardous chemical substance (HCS) have attracted the interests of many scholars, since failure of storage tanks may result in severe consequence due to the massive release of HCS (Yang et al. 2018; Cozzani et al. 2005; Barjoe et al. 2022).
