The cooling energy storage capacity of each capsule is compared in Fig. 10. Apparently, pure water without fin has the highest capacity of cooling energy storage which is 322.8 kJ?kg -1 under the condition of T i = 276.15 K, T c = 268.15 K. With the addition of fin-I and fin-II series, approximately  $0.9\% \sim 1\%$  storage capacity is lost.

Herein, a photothermal energy-storage capsule (PESC) by leveraging both the solar-to-thermal conversion and energy-storage capability is proposed for efficient anti-/deicing. Under ...

Among various energy storage approaches, ice storage is widely used in building air conditioning (Elhelw and El-Maghlany, 2020), performance improvement of power plants (Chen et al., 2023), etc. due to its high energy storage density that occupies little area compared to energy stored through sensible heat.

Latent heat thermal energy storage (LHTES) captures the thermal energy via a solid-liquid phase transition that occurs in phase-change materials (PCM). The PCM is usually encapsulated in some way. In this study, we consider PCM melting in a vertical cylindrical enclosure, that is a prototype of a capsule used in a future storage system.

Phase change materials (PCMs) store latent heat energy as they melt and release it upon freezing. 1 Therefore, at temperatures close to their melting point (T M), PCMs ...

The use of packed beds containing encapsulated capsules can markedly improve the efficiency of latent heat thermal energy storage systems. The capsule effective thermal conductivity is a crucial ...

Basic experiments were carried out to simulate a solar energy storage capsule, using a horizontal cylindrical capsule (300 mm length, 40 mm o.d.) filled with naphthalene as the phase change material. The variation of heat flux during the processes of heat storage and removal was measured by a heat flow meter wrapped around the capsule, as the ...

A numerical analysis of melting of an organic phase change material (PCM) in a square thermal energy storage (TES) capsule with an array of high voltage wire electrodes has been performed. Fully coupled set of governing equations for fluid flow, heat transfer, phase change, electric field and charge transport are solved using the opensource ...

The energy storage capacity for the 100 mm capsule is 85.35 % higher than that of the 50 mm capsule and 42.06 % higher than that of the 75 mm capsule. At a bath temperature of -9 °C, the energy stored increases by 91.13 % compared to the 50 mm capsule and by 45.90 % compared to the 75 mm capsule.

In addition, the change of the capsule centroid can affect the interaction between the capsule and HTF, and then affect the convective heat transfer inside and outside the capsule. Fluidized PCM capsule energy storage is expected to make full use of the movement of the solid-liquid interface relative to the wall to enhance heat transfer and ...

KEYWORDS: heat storage, salt hydrates, capsule, Pickering emulsion, silica shell, thermal energy E nvironmental and sustainability concerns have made energy one of the most important issues in science. Energy storage, in particular, is vital to combat the intermittency of many renewable energy sources. A somewhat

Fig. 1 (a) depicts the structure of the investigated "EPCM-HP unit" (a side view), which consists of a single cylindrical EPCM capsule and two identical horizontal heat pipes. A number of such EPCM-HP units can be filled in the heat storage tank with HTF flowing through the voids to perform charging/discharging process.

Dielectric electrostatic capacitors 1, because of their ultrafast charge-discharge, are desirable for high-power energy storage applications. Along with ultrafast operation, on ...

The urgency to reduce CO 2 emission and manage climate change crisis have stimulated the interests in exploiting cleaner and more sustainable energy source to alter traditional fossil fuels. China has also announced the target to reach CO 2 emissions peak before 2030 and achieve carbon neutrality before 2060. Among technological innovations, recent ...

Initially, the energy is stored inside the capsules as sensible heat until the PCM reaches its melting temperature. As the charging process proceeds, energy storage is achieved by melting the PCM at a constant temperature. Finally, the PCM becomes superheated. The energy is then stored as sensible heat in liquid PCM.
