2. Phase change material (PCM) PCMs are types of material that may keep a massive quantity of heat at a nearly consistent temperature while transitioning from one step to the next. They have the ability to store heat energy in both sensible and latent forms.

What determines the value of a phase change material?

The value of a phase change material is defined by its energy and power density--the total available storage capacity and the speed at which it can be accessed. These are influenced by material properties but cannot be defined with these properties alone.
