The PV + energy storage system with a capacity of 50 MW represents a certain typicality in terms of scale, which is neither too small to show the characteristics of the system nor too large to simulate and manage. This study builds a 50 MW "PV + energy storage" power generation system based on PVsyst software.

The energy storage devices improve solar energy contribution to the electricity supply even when the unavailability of solar energy. It also helps to smooth out the fluctuations in how solar energy transmits on the grid network. These fluctuations are attributable to changes in the quantity of sunlight that shines onto PV panels.

What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. These cells are made of different semiconductor materials and are often less than the thickness of four human hairs.
