

Potential customers for electric energy storage

Is energy storage a viable resource for future power grids?

With declining technology costs and increasing renewable deployment, energy storage is poised to be a valuable resource on future power grids--but what is the total market potential for storage technologies, and what are the key drivers of cost-optimal deployment?

What are the benefits of energy storage?

There are four major benefits to energy storage. First, it can be used to smooth the flow of power, which can increase or decrease in unpredictable ways. Second, storage can be integrated into electricity systems so that if a main source of power fails, it provides a backup service, improving reliability.

Why do companies invest in energy-storage devices?

Historically, companies, grid operators, independent power providers, and utilities have invested in energy-storage devices to provide a specific benefit, either for themselves or for the grid. As storage costs fall, ownership will broaden and many new business models will emerge.

Is it profitable to provide energy-storage solutions to commercial customers?

The model shows that it is already profitable to provide energy-storage solutions to a subset of commercial customers in each of the four most important applications--demand-charge management, grid-scale renewable power, small-scale solar-plus storage, and frequency regulation.

What is the market potential of diurnal energy storage?

The market potential of diurnal energy storage is closely tied to increasing levels of solar PV penetration on the grid. Economic storage deployment is also driven primarily by the ability for storage to provide capacity value and energy time-shifting to the grid.

Does storage reduce electricity cost?

Storage can reduce the cost of electricity for developing country economies while providing local and global environmental benefits. Lower storage costs increase both electricity cost savings and environmental benefits.

In some countries with winter-peaking demand, storage heating has accounted for a substantial slice of the market: roughly a fifth of domestic electricity in the UK in 2012 was supplied during off-peak hours, much of it for storage heating and water heating, while approximately 1.7 million residential customers (6-7% of the total) were using ...
