Consider a power bank with an energy content of 37 Wh and a capacity of 10 Ah. Compared to the residential battery System A with a capacity six times as large, the energy content of the power bank is as much as 264 times smaller. This is due to the difference in internal voltage, as the power bank battery voltage is only 3.7 V.

This can be counter-intuitive because it means that a, say, 4-hour duration battery would be cheaper than 1-hour duration battery, given then same energy storage capacity (kWh), because this implies it will have a lower charging ratio or power output (kW).
