Consider the circuit in Fig. 18.27 where the HV power supply, PS, V dc charges an energy storage capacitor bank C dc. The PS internal resistance added by the switch and wiring ohmic resistances is represented by R dc that limits the maximum charging current.

lasers optical amplifiers. Modular in design, each of the 192 Main Energy Storage Modules (MESMs) storage up to 2.2 MJ of electrical energy in its capacitor bank before delivering the energy to 20 pairs of flashlamps in a 400 μ s pulse (10% power points). The peak current of each MESM discharge is 0.5 MA.

Charge storage refers to the capacitance that actually powers the amplifier when the pulse is in transition. The inductance of the power supply leads prevents the DC current from instantaneously jumping from zero to IDS.

The capacitors for pulse applications feature solder lugs or snap-in terminals for connection. These capacitors ensure constant pulse factors, even under conditions of large number of continuous discharges with short pulse repetition intervals. They feature low leakage currents and thus help the application be as energy efficient as possible.
