What is the difference between mechanical and electrochemical energy storage?

Storing mechanical energy is employed for large-scale energy storage purposes, such as PHES and CAES, while electrochemical energy storage is utilized for applications that range from small-scale consumer electronics to large-scale grid energy storage.

Can mechanical energy be stored statically?

Mechanical energy can be stored statically in conventional mechanical springs made of steel, but displays a low gravimetric energy density (GED) of ~ 1.4 × 10 -4 MJ kg -1 (ref. 7). Less compact mechanisms for reversibly storing high energy densities include pumped hydroelectricity, compressed gases and carbon T1000 flywheels 8.

A flywheel is a rotating mechanical device that is used to store rotational energy that can be called up instantaneously. At the most basic level, a flywheel contains a spinning mass in its center that is driven by a motor - and when energy is needed, the spinning force drives a device similar to a turbine to produce electricity, slowing the rate of rotation.

There are three main types of MES systems for mechanical energy storage: pumped hydro energy storage (PHES), compressed air energy storage (CAES), and flywheel energy storage (FES).
