

Soil energy storage pool

How do we calculate carbon storage in vegetation and soil pools?

We used the carbon transfer rate (or turnover time) method to calculate carbon storage in vegetation and soil pools. These results will aid in assessing carbon budgets and in predicting ecosystem carbon responses to climate change.

Do vegetation and soil carbon pools have stable carbon storage?

Both vegetation and soil carbon pools have relatively stable carbon storage (Yang et al. 2010, Fang 2011), even though carbon is continuously moving between among vegetation, soil, and the atmosphere (Dixon et al. 1994, Wang et al. 2001).

Do soil carbon pools control the global distribution of POPs?

The background levels of POPs were estimated in conjunction with the global soil database. It led to the proposition that the stable soil carbon pools are key controlling factors affecting the ultimate global distribution of POPs, so that the dynamic cycling of soil carbon acts to counteract the cold-trapping effects.

How much SOC and SIC is stored under the topsoil layer?

This study discovered that the SOC and SIC storage of the whole soil profile (0-20 m) was 9 and 24 times that of the topsoil layer (0-1 m), respectively. The results indicated that the study area stores large amounts of SOC and SIC below the topsoil profile.

What affects labile soil carbon pools in subtropical forest and agricultural ecosystems?

Labile soil carbon pools in subtropical forest and agricultural ecosystems as influenced by management practices and vegetation types. *Agric. Ecosyst. Environ.* 65: 69-78 [Google Scholar] Huang W, Spohn M. 2015. Effects of long-term litter manipulation on soil carbon, nitrogen, and phosphorus in a temperate deciduous forest.

Is soil carbon storage underestimated?

Furthermore, since SIC storage is a substantial component, 9-10 times SOC storage in the 0-20 m soil profiles for different land uses (Fig. 4 a,b). Therefore, soil carbon storage might have been greatly underestimated in this area and other similar regions 9, 44, 45.

As one of the primary medium for ecosystem energy flow and biogeochemical cycling, grassland carbon (C) cycling is the most fundamental process for maintaining ecosystem services. ... NEP) and C storage (plant biomass and soil C pool) based on meta-analyses of manipulative global change experiments. Manipulative experiments demonstrate that ...

Global carbon pools refer to the various reservoirs or storage areas where carbon is stored on Earth. Understanding these carbon pools is crucial for comprehending the carbon cycle, which plays a fundamental

role in regulating the Earth's climate. Atmosphere: The atmosphere contains carbon dioxide (CO₂) and other greenhouse gases. Human activities, ...

Another consequence of this new understanding is that since most N in the long-term storage pool is labile but protected from degradation by inaccessibility, simply measuring the amount of labile N in a soil may overestimate the amount of N in the bioavailable pool and misrepresent the N status of the ecosystem (Darrouzet-Nardi and Weintraub ...

Adding organic inputs to soils increases carbon storage, but soils can only store so much carbon. This phenomenon of "soil carbon saturation" could result from properties of soil itself. For example, there is a widely assumed upper limit to soil carbon that increases with soil clay content.

Substantially more carbon is stored in the world's soils than is present in the atmosphere. The global soil carbon (C) pool to one-meter depth, estimated at 2500 Pg C, of ...

For Veg-C storage, the analyzed factors included climate (MAT and MAP), soil nutrient (soil N, P, and K), and soil texture (clay, silt, and sand); for SOC storage, the analyzed factors included ...

The energy availability of a substance or pool of substances is the ratio of the energy obtained and consumed through any activity to the energy that a (micro)organism or community would have to invest to utilize the substance (Equation 1) under real soil conditions. Energy availability ranges from 0 (not available, i.e., the organic com-

Terrestrial carbon storage has two important carbon pools, the vegetation carbon pool and the soil carbon pool (Li et al. 2007). Quantification of terrestrial carbon in each of these carbon pools is important for assessing ...

Soil C pools, one of the critical components of global C cycling, store around 2500 billion tonnes of soil organic C (SOC), at least three times more than C found in the atmosphere or living biomass (Lal, 2004; Schmidt et al., 2011). SOC contributes roughly 60% of the mass of soil organic matter (SOM), a mixture of heterogeneous materials including ...

Background and aims Grassland ecosystems play a vital role in soil carbon (C) sequestration and experience human disturbances that influence soil C storage. Nitrogen (N) enrichment elevates C assimilation and C return, and pervasive interactions between N and C inputs occur but have seldom been addressed simultaneously. This study evaluated the ...

Such combination of PV units, ASHP and underground soil thermal energy storage medium was not investigated before to fulfil electricity, space heating and domestic hot water needs. The study aligns well with the Danish government energy strategy to attain a fossil fuel-free energy sector by 2050 and the initiatives to expand the use of heat ...

TES systems are divided into two categories: low temperature energy storage (LTES) system and high temperature energy storage (HTES) system, based on the operating temperature of the energy storage material in relation to the ambient temperature [17, 23]. LTES is made up of two components: aquiferous low-temperature TES (ALTES) and cryogenic ...

Soil Carbon Sequestration by Switchgrass: Potential and Management: Mark Liebig: U.S. Department of Agriculture-Agricultural Research Service: Forest Management Practices to Optimize Soil Carbon Storage: Importance of Soil Carbon and Below-Ground Biomass on Greenhouse Gas Balance in Willow Biomass Crops: Tim Volk: State University of New York ...

MAOM stored 1.7 times more energy per unit of C (42 kJ \cdot g $^{-1}$; C) than did the free and occluded POM fractions (25 kJ \cdot g $^{-1}$; C). fPOM was the dominant energy pool for labile C in the restored ...

On March 28-29, 2022, join the U.S. Department of Energy Bioenergy Technologies Office for a public virtual workshop titled, Bioenergy's Role in Soil Carbon Storage. Below are the speaker bios for this workshop.

The soil water storage of PO, PT and AO was significantly different from that of FL with a decrease of 1169.32, 1161.60 and 1139.63 mm, respectively. ... The soil carbon pool includes soil organic ...

This occurs through four different processes associated with energy provision; acquisition of the energy source, conversion/storage, transport/transmission and end use/disposal of residues from the energy conversion process . Acquisition of energy from the soil itself is a direct impact of soil on energy provision; this includes burning of peat ...

A major challenge facing BTES systems is their relatively low heat extraction efficiency. Annual efficiency is a measure of a thermal energy storage system's performance, defined as the ratio of the total energy recovered from the subsurface storage to the total energy injected during a yearly cycle (Dincer and Rosen, 2007).Efficiencies for the first 6 yr of ...

Introduction. Terrestrial carbon storage is one component of the global carbon cycle, and it is often used in policymaking decisions to control CO₂ emissions (Zhang et al. 2011).Terrestrial carbon storage has two important carbon pools, the vegetation carbon pool and the soil carbon pool (Li et al. 2007).Quantification of terrestrial carbon in each of these carbon ...

Soil-Borehole Thermal Energy Storage Systems for District Heating John S. McCartney 1, Adam Reed 1, Shemin Ge 1, Ning Lu 2, and Kathleen Smits 2 1 University of Colorado Boulder, UCB 428 ...

Soil carbon and nitrogen pools are crucial for maintaining the balance of carbon and nitrogen cycling in ecosystems and also for reducing the impacts of global climate change. However, current research lacks an understanding of the effects of long-term vegetation restoration on soil carbon and nitrogen pools and their

storage in vulnerable ecosystems. ...

Microbial necromass is an important contributor to soil organic carbon (SOC) storage, and serves as a resource pool for microbial utilization. The trade-off between microbial births/deaths and resource acquisition might influence the fate of microbial necromass in the SOC pool, which remains poorly understood. ... Genetic evolution is an energy ...

Soil labile organic carbon sensitively reflects subtle changes in the soil carbon pool and is an important aspect of forest soil carbon pool research. However, little is known regarding soil labile organic carbon storage and its dynamic changes during the development of *Quercus acutissima* Carruth. forests. Consequently, we investigated the dynamic changes in ...

The Bioenergy Technologies Office hosted the Bioenergy's Role in Soil Carbon Storage Workshop in March 2022, which covered the topic of soil carbon storage with a focus on the role of bioenergy.. Input and insight from the workshop were sourced from diverse experts, including governmental, industrial, agricultural, silvicultural, and academic stakeholders.

In the context of climate change and the circular economy, biochar has recently found many applications in various sectors as a versatile and recycled material. Here, we review application of biochar-based for carbon sink, covering agronomy, animal farming, anaerobic digestion, composting, environmental remediation, construction, and energy storage. The ...

The conversion of forests into agricultural lands can be a threat because the forests carbon stored could be a source of emissions. The capacity to improve the predictions on the consequences of land use change depends on the identification of factors that influence carbon pools. We investigated the key driving factors of tree biomass and soil carbon pools in ...

Understanding the factors that control the storage of soil organic carbon (SOC) is an urgent priority for mitigating global climate problems. The objective of this study was to ...

The soil carbon pool includes soil organic carbon (SOC) and soil inorganic carbon (SIC) pool. The soil carbon storage in the top 1 m layer is around four times the vegetation ...

Soil Carbon Storage Is Derived from Root Carbon Inputs Field studies clarify the role of roots in soil carbon storage To a large degree, the sources and stability of soil organic carbon remain poorly constrained. A clear understanding of links among the components of the soil C cycle is hampered by the complexity of the [...]

Globally, cropland stores more than 140 Pg C in the top 30 cm of soil, almost 10% of the total global SOC pool. About 94% of this carbon (131.81 Pg C) is stored on the 15.9 million km² (98% of ...

The project Driver Pool aims to understand the interplay between energy fluxes/thermodynamic balances and

Soil energy storage pool

substrate turnover pathways, modulated by shifts in microbial abundance, community structure and functioning. ... may be distributed among various functional pools in soil that can be energetically distinguished in "enthalpy storage pools ...

The soil organic matter resides in four major pools: plant residue (i.e., litter), microbial biomass, humads (i.e., active humus), and passive humus. Each pool consists of two ...

In the agroforestry system, the organic matter in the farmland and natural ecosystem enters the farmland soil in a mixed form to improve soil fertility and carbon pool quality. However, it is unclear how soil microbial carbon-degrading enzyme activity responds to carbon dynamics in this process. Therefore, we took farmland in the Loess Plateau as the research ...

On March 28-29, 2022, join the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy Bioenergy Technologies Office for a public virtual workshop to discuss soil carbon storage with a focus on the role of bioenergy.

The numerical proportions of different granular aggregates and their structural stabilities are important for improving soil fertility and maintaining the soil carbon pool. Soil aggregates can be divided into two categories based on their particle size: large aggregates (>0.25 mm) and microaggregates (<0.25 mm).
