A pressure reducing valve (PRV) is an essential device in plumbing applications, designed to regulate and maintain a constant downstream pressure, regardless of fluctuations in the incoming pressure. By controlling the pressure, PRVs protect appliances and systems from damage, conserve energy, and optimise performance.

As well as compressed gas and liquid storage, hydrogen can also be stored in materials-based containers. To store hydrogen under compressed gas, high-pressure vessels are required. With increased storage pressure, the energy density per unit mass increases, but the cost of the storage vessel increases. Hydrogen is compressed up to 350-700 bars.

calculate the maximum working pressure of the solar system as follows :  $Pvs \ll 5$  bar, Pmax = Pvs - 0.5 [bar] Pvs > 5 bar,  $Pmax = 0.9 \times Pvs$  [bar] Pmin: minimum working pressure on the expansion vessel [bar]. Minimum working pressure on the expansion vessel equals the sum of the pressure due to the static head on the expansion vessel and
