

What is a solar water heater?

Solar water heaters -- sometimes called solar domestic hot water systems-- can be a cost-effective way to generate hot water for your home. They can be used in any climate, and the fuel they use -- sunshine -- is free. Solar water heating systems include storage tanks and solar collectors.

What are the components of a solar hot water heating system?

How does a solar water heater work?

Water is heated in a collector on the roof and then flows through the plumbing system when a hot water faucet is opened. The majority of these systems have a 40 gallon capacity. Most solar water heaters require a well-insulated storage tank. Solar storage tanks have an additional outlet and inlet connected to and from the collector.

What is a solar thermal storage tank?

Solar thermal storage tanks are an essential element of solar water heating systems. They store the heat collected by the solar collectors during the day and provide hot water for use at night or on cloudy days. The efficiency and performance of a solar thermal storage tank largely depend on its design and the materials used in its construction.

Does a solar hot water system have a backup system?

Lastly, every solar hot water system comes with a backup system. On cloudy days when there isn't enough sun to generate enough heated water from solar energy, your backup heater will kick in and generate hot water for your home with gas or electricity. Backup heaters will account for roughly 20 percent of your hot water use yearly.
