What is the energy storage strategy?

The Strategy is part of the set of actions planned to meet the objectives established in the National Integrated Energy and Climate Plan 2021-2030 and the Long-Term Decarbonization Strategy and envisages having a total energy storage capacity of around 20GW in 2030 and 30GW by 2050, when the current capacity stands at 8.3 GW.

What is long duration energy storage (LDEs)?

The 2023 NECP proposes a 173% increase (or 85 GW) in renewable capacity by 2030 from current capacities<sup>1</sup>; storage<sup>2</sup> is expected to increase by 487%, or 15 GW from installed capacity. Long Duration Energy Storage (LDES) can ensure renewable energy is utilised in the system while decreasing reliance on CO<sub>2</sub> emitting technologies

Will 15 GW of energy storage eliminate economic curtailment by 2035?

Deploying 15 GW of electrical energy storage, alongside ambitious renewables growth, would eliminate economic curtailment by 2035, Aurora's modelling shows. Renewable energy that would otherwise have been curtailed during periods when running costs surpass market prices would instead be used to charge LDES assets.

A general tendency towards an increasing use of energy storage can be observed. Four different aspects are considered: First, the use of storage technology in order to solve the problem of availability of renewable energy sources (day-to-night shift for photovoltaic plants as a first example) or the bridging of a lack of production of fluctuating sources.

Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including the US, Australia and Germany. Thermal energy storage is predicted to triple in size by 2030. Mechanical energy storage harnesses motion or gravity to store electricity.
