Anyways, steam storage tanks are just energy storage, and if you think about it the available coal is also stored energy waiting to be used. Converting it from one type of storage to the other is usually of limited benefit. One storage tank of 165 °C steam holds up to 750 MJ of energy, which is equal to 187.5 pieces of coal, which sounds like ...

Just like any other energy storage technology, steam as energy storage works by charging and discharging. The Charge - The charging process involves filling the steam storage tank half-full with cold water. Thereafter, steam generated through solar heating is blown into the tank through perforated pipes located near the bottom of the tank. ...

A storage tank filled with heat exchanger 500 °C steam stores around 2.4GJ; a storage tank filled with boiler 165 °C steam stores 750MJ. Calculations. 1 Storage tank can store 25,000 units of 500 °C steam. 1 Steam turbine can output 5,820kW = 5,820kJ/s using 60 units of 500 °C steam/s. 1 Storage tank can keep 1 steam turbine working at full ...

$0.84 * 5 = 4.2$, so for every solar panel we need 4.2MJ of storage. One storage tank of 165 degree steam holds $750\text{MJ} / 4.2 = 178.571428571$ solar panels per steam tank. For 1 solar panel you thus need $1 / 178.571428571$ steam tanks or 0.056, same as your result. Now a little extra math just to juggle your numbers around:
