FUNDAMENTALS OF CIRCUIT BREAKERS The two-step stored energy mechanism is used when a lot of energy is required to close the circuit breaker and when it needs to close rapidly. The two-step stored energy process is to charge the closing spring and release energy to close the breaker. It uses separate opening and closing springs.

The so-called energy storage means that when the circuit breaker is de-energized (that is, when it is opened), it opens quickly due to the spring force of the energy storage switch. Of course, the faster the circuit breaker is opened, the better.
