What are the three types of electrochemical energy storage?

This chapter describes the basic principles of electrochemical energy storage and discusses three important types of system: rechargeable batteries, fuel cells and flow batteries. A rechargeable battery consists of one or more electrochemical cells in series.

How do electrochemical energy storage devices work?

The principle of operation of electrochemical energy storage devices is based on the formation of a chemical reaction between the electrolyte and the electrodes contained in it. Then there is a shortage of electrons on one of the electrodes and an excess on the other. This allows chemical energy to be converted into electrical energy.

Who invented the energy storage system?

The first energy storage system was invented in 1859 by the French physicist Gaston Planté. He invented the lead-acid battery, based on galvanic cells made of a lead electrode, an electrode made of lead dioxide (PbO_2) and an approx. 37% aqueous solution of sulfuric acid acting as an electrolyte.
