What is thermal energy storage?

Thermal energy storage (TES) is the storage of thermal energy for later reuse. Employing widely different technologies, it allows surplus thermal energy to be stored for hours, days, or months. Scale both of storage and use vary from small to large - from individual processes to district, town, or region.

What is the difference between thermal protection and energy storage?

The objective of thermal protection is to decrease or shift the heating/cooling load of a system, while the objective of an energy storage system is to store the thermal energy released from the system on demand [215, 221, 222].

What are sensible and latent thermal energy storage?
