Abstract. Owing to the high storage capacity of the latent heat energy storage unit (LHSU), it is preferred among other types of thermal energy storage to overcome the mismatch between energy supply and demand. The distribution of the inner tubes in the Tube-in-shell thermal storage device is also a way to increase the efficiency of energy storage. For the Tube-in-shell thermal storage device with a single tube, the distribution of the inner tubes is the position of the inner tubes, which is generally indicated by the eccentricity [21, 22].

Energy storage systems are considered a critical solution to answering this intermittency. Latent Heat Storage (LHS) systems have been recognized as promising technologies due to their high energy storage capacity in an isothermal condition at a wide range of temperatures [1], [2]. LHS systems are relied on the effective usage of phase change ...
