

Can uranium be used as a fuel for energy storage?

Conclusion In summary, a novel uranium extraction cell for both efficient uranium extraction and energy storage is introduced for the first time to our best knowledge. It could transform uranium in both wastewater and seawater into UO_2 fuel while providing electricity.

Why is uranium extraction important?

Uranium extraction from uranium mine wastewater is of great interest from both the environmental protection and the resource preservation perspectives. To tackle the likely shortage of uranium resources, uranium extraction from wastewater is an important, yet often underestimated, supplement to seawater uranium extraction.

How does electrochemical uranium recycling work?

In real nuclear wastewater, the uranium is electrochemically extracted with a high efficiency of 99.6% and finally purified as uranium oxide powder, corresponding to an extraction capacity of 6829 mg g^{-1} without saturation. This work paves an efficient way for electrochemical uranium recycling in real wastewater of nuclear production.

How important is uranium supply?

Harikrishnan Tulsidas, Economic Affairs Officer, United Nations Economic Commission for Europe "As new power reactors come online and others are retired, proper supply and management of uranium will be a critical factor in energy supply in the coming decades," said Adrienne Hanly, uranium resources specialist at the IAEA.

Can uranium be extracted efficiently from water?

The challenge of efficiently extracting uranium from water is hereby addressed by a novel idea based on fuel cell principle: uranium extraction cell (UEC). The uranium extraction cell transforms uranium in both wastewater and seawater to UO_2 fuels and electricity simultaneously, enabling both functions of uranium extraction and energy storage.

Can uranium extraction material resist high concentrations of F?

Our work not only presents an efficient uranium extraction material for resisting high concentrations of F⁻, but also provides an efficient strategy for uranium recovery in real and complex nuclear wastewater.

In this work, the emulsion template method was employed to create a functionalized microcapsule adsorbent (PDA-PO 4 3- /PEG) with dual capabilities for adsorption and thermal storage. The oil-water interface was stabilized using sodium dodecyl sulfate, while dopamine acted as a monomer for polycondensation at the interface, polyethylene glycol (PEG) was utilized as a phase ...

Batch adsorption experiments showed that the adsorbent can effectively remove uranium from uranium-containing solution with uranium removal efficiencies up to 99 %. The uranium adsorption on phosphorus-doped biochar tolerated a wide pH range (pH 2.0-6.4) and high ionic strength. The maximum uranium adsorption capacity was tested to be 603 mg/g.

In December 2017, STUK granted the company permission to recover a small quantity of uranium while experimenting with chemical processes it will use in an actual uranium recovery plant. Under that permit, the company could produce up to 600 litres of process solution containing a maximum of 6 kg of uranium.

Previous studies show that large amounts of uranium (U) and its analogues such as cerium (Ce) and thorium (Th) can be incorporated into the garnet structure. In this study, we synthesized U loaded garnet phases, $Ca_3U_xZr_{2-x}Fe_3O_{12}$ ($x = 0.5 - 0.7$), along with the endmember phase, $Ca_3(Zr_2)SiFe_3O_{12}$, for comparison.
